# 1. Introduction

## 1.1 MODBUS Protocol

The following describes the functionality of the Modbus App in the form of possible configuration, operating modes and the Modbus register specification. A detailed description of the Modbus protocol and its operation can be found in the Modbus specification (see [www.modbus.org](http://www.modbus.org)). Modbus TCP is part of the IEC 61158 standard.

The Modbus data interface can be used in the following operating modes:

- Modbus TCP Slave
- Modbus RTU Slave

### **Modbus TCP via Ethernet interface**

In Modbus TCP Slave mode, the KOSTAL Smart Energy Meter provides its Modbus registers over TCP/IP. Access to this interface requires network connection via Ethernet. The Modbus slave can be reached in accordance with the industry standard under port number 502.

### **Modbus RTU via RS485 interface**

In Modbus RTU Slave mode, the KOSTAL Smart Energy Meter provides its Modbus registers via RS485. Both RS485 interfaces, RS485 A and RS485 B, can be individually configured for this purpose. Details on the connection to the RS-485 socket and the polarity reversal of the interface can be found in the KOSTAL Smart Energy Meter installation manual.

# 2. MODBUS protocol description

## 2.1 Register Specification

The data registers can be divided into different areas. The data points of the KOSTAL Smart Energy Meter are coded according to the OBIS standard. In addition, in the register area 40000-40177, the data points are encoded according to SunSpec Alliance standards:

- SunSpec Alliance Interoperability Specification – Common Models
- SunSpec Alliance Interoperability Specification – Meter Models

## 2.2 Reading out registers

Most data points of the KOSTAL Smart Energy Meter are distributed to several 16-bit registers. This means that an RTU master / TCP client should request all registers of a data point in one and the same request.

Interpretation of data points with multiple registers: In the case of a multi-register data point, the registers with the lower address contain the „most significant“ bits. The „least significant“ bits are contained in the registers with the higher address.

Example Principle: A fictitious data point „TotalOperatingHours“ (uint32) is located at offset 0x1000. The data point should contain 2293828 operating hours.

- the address 0x1000 contains 0x23
- the address 0x1001 contains 0x44

During the request, both registers are transmitted in the network byte order (Big Endian) as specified by the Modbus specification. A „Read Holding Register“ for both registers provides 0x00 0x23 0x00 0x44.

### Example conversion:

In order to read the referenced active power (+), the (integer) values of the „holding registers“ 0 and 1 can be used:

$$\text{Active power+ [W]} = (\{\text{register 0}\} \cdot 2^{16} + \{\text{register 1}\}) \cdot 0.1 \text{ [W]}$$

In order to read out the related active energy (+), that is to say the related active energy over all phases, the (integer) registers 512 to 515 can use:

$$\text{Active energy+ [Wh]} = (\{\text{register 512}\} \cdot 2^{48} + \{\text{register 513}\} \cdot 2^{32} + \{\text{register 514}\} \cdot 2^{16} + \{\text{register 515}\}) \cdot 0.1 \text{ [Wh]}$$

# 3. MODBUS Register table

## 3.1 Overview Register Areas

Start address (dec)	End address (dec)	Start address (hex)	End address (hex)	Size	Description
0	145	0x0000	0x0091	146	Internal instantaneous registers
512	791	0x0200	0x0317	280	Internal Energy registers (counters)
8192	8243	0x2000	0x2033	52	KSEM/RM PnP registers
40000	40177	0x9C40	0x9CF1	178	SunSpec registers

## 3.2 Overview internal instantaneous register

Start address (dec)	End address (dec)	Start address (hex)	End address (hex)	Size	R/W	Function codes	Type	Units	OBIS-Code	Description

## 3.4 Overview KSEM/RM PnP register

Start address (dec)	End address (dec)	Start address (hex)	End address (hex)	Size	R/W	Function codes	Type	Name	Default value / example	Description
8192	8192	0x2000	0x2000	1	RO	0x03	uint16	ManufacturerID	0x5233	Fixed value to identify every device
8193	8193	0x2001	0x2001	1	RO	0x03	uint16	ProductID	0x4842	Indicates that this device is a KOSTAL Smart Energy Meter
8194	8194	0x2002	0x2002	1	RO	0x03	uint16	ProductVersion	Example: 0x0000	(Hardware) Revision of the KOSTAL Smart Energy Meter processor board
8195	8195	0x2003	0x2003	1	RO	0x03	uint16	FirmwareVersion	Example: 0x0103 = 1.3.x	Firmware Revision of the KOSTAL Smart Energy Meter
8196	8211	0x2004	0x2013	16	RO	0x03	string (32)	VendorName	Example: KOSTAL Solar Electric GmbH	Contains the vendor name as a string, padded with NUL bytes
8212	8227	0x2014	0x2023	16	RO	0x03	string (32)	ProductName	Example: KSEM	Contains the product name as a string, padded with NUL bytes
8228	8243	0x2024	0x2033	16	RO	0x03	string (32)	SerialNumber	Example: 30380912332211	Contains the serial number of the device as a string, padded with NUL bytes
8244	8244	0x2034	0x2034	1	RO	0x03	uint16	MeasuringInterval	Example: 0x01F4 = 500 ms	Contains the measuring interval for measurement chip in ms
8245	8248	0x2035	0x2038	4	RO	0x03	uint64	UNIXTimestamp	Example: 1552323559000 = 2019-03-11 16:59:19	Contains the current UNIX timestamp in ms

The KSEM/RM PnP register contains information on the identity of the device.

- ManufacturerID is a static value that contains the ID of the manufacturer. An overriding SCADA system can differentiate between different devices on the RS-485.
- ProductID is also a static value that allows the identification of the specific product via this key.
- ProductVersion is the version of the hardware of the product.
- FirmwareVersion is the version of the software of the product.
- VendorName and product name include the name of the manufacturer and the name of the product as strings.

All strings are filled to their full length by NUL bytes and spaces (0x32). The Modbus RTU Master / TCP Client should auto-cut them before using the strings.

## 3.5 Overview SunSpec register

## Notes:

<sup>1</sup> Note to avoid off-by-one errors: The SunSpec specification (as found at [www.sunspec.org](http://www.sunspec.org)) always refers to register numbers, whereas this document always refers to register addresses. To access SunSpec register 40001, the register address 40000 must be used, i. Hexadecimal offset 0x9C40.

<sup>2</sup> These fields may receive a customer fire request upon request

<sup>3</sup> Example: The register M\_AC\_Freq contains the value 4950 and M\_AC\_Freq\_SF contains the value -2. Then the frequency can be calculated as:  
 $4950 \text{ Hz} * 10^{-2} = 49.50 \text{ Hz}$

<sup>4</sup> Important Note: Although the scaling factors are given here as fixed values, they should not be considered fixed. The values can change dynamically to match the readings. Please always ask the scaling factors together with the associated values and include code to dynamically calculate the values.
