

1. Outline

RX-Vx700 in this protocol refers to the RX-V1700 and RX-V2700.

1.1 Connection

5 wire system

*When not connected, data transmission to RX-Vx700 is prohibited (CTS port pull down).

1.2 RS-232C Settings

*Full duplex, start-stop synchronization communication

Baud rate	9600bps
Data bits	8
Parity	No
Stop bit	1bit
Handshaking	Hardware

*The RX-Vx700 RTS port outputs at low level when the AC plug is disconnected.
If RTS output stays low even when the AC plug is connected, a problem may occur.

1.3 Data block timeout

It takes the RX-Vx700 a maximum of 500msec to send one data block. If a complete data block is not received within 500msec, cancel the transaction. A problem may occur.

2. Start Commands

2.1 Starting Communication

The Ready command is the first command to be sent to the RX-Vx700 at the start of communication. TOUT0 - 2 in the Ready Command sets communication timeout.

RX-Vx700 sends a Configuration command (Model ID, software version and setting data) to the host in reply to the Ready command.

The RX-Vx700 will send a Configuration command within 1 sec. after receiving a Ready command from the host. If not, send a Ready Command again (max 5 times).

If the RX-Vx700 won't send a Configuration command after the fifth retry, cancel the transaction because there may be a problem.

- *TYPx Model ID = "R0210" (RX-V1700)
Model ID = "R0212" (RX-V2700)
- *VER Software Version
- *SUM The sum of all data except for the header and footer

function name	function	data (ASCII)	range (HEX)
TOUT0 - 2	communication timeout	0 - 9, A - F	0 - 0xFFF

*timeout between the header and the footer

*timeout=0 means no timeout

function name	function	data (ASCII)	range (HEX)
TYP0 - 4	model ID	0 - 9, A - F	voluntary
VER	software version	A - Z	voluntary
L0 - 1	data length	0 - 9, A - F	0 - 0xFF
DT0 - 255	data	0 - 9, A - F	0 - 0xF
SUM0	upper 4 bit of SUM	0 - 9, A - F	0 - 0xF
SUM1	lower 4 bit of SUM	0 - 9, A - F	0 - 0xF

*Data Structure of Configuration Command

When the power is OFF, only DT0,1,...,9 are sent to the Host.

DT172	16	0 - F	Flag	Upper 4 bit
DT173		0 - F		Lower 4 bit

*OSD = On Screen Display

3. Control Commands

- * The RX-Vx700 can receive control commands only when the power is on (except Power commands and System commands*).
- * Do not send any control commands when the system status is Wait. No commands are permitted until the RX-Vx700 reports OK.
- * The RX-Vx700 will send a Report Command** within 1 sec of receiving the Control Command. If no Report Command is received, resend control command (max 5 times).
If the RX-Vx700 doesn't send a Report Command after the fifth retry, cancel the transaction because there may be a problem.
- * 'SW' switches the type of the control command. When the 'SW' is set to '0', you can control the RX-Vx700 remotely via RS-232C.
- * The RX-Vx700 will only send one report command for each type of control. The Report Command will report only the final status of all settings in strings of commands (may not report all steps in a status, only final status).
For example, if the user sets the input selector on the unit to DTV just after the host sends a command to change the input to CD, the RX-Vx700 may report only the final status that the input was changed to DTV by the system operation.

*System command, **Report command --> described in later

- Command Switch (changing the type of control command)

function name	function	data (ASCII)	range (HEX)
SW	command switch	0 - 9	0 - 9
CMDT0 - 3	command & data	0 - 9, A - F	variable

- * 'SW' switches the command type of the Control Command.
- SW=0 : 4 byte command for remote control code (**CMDT0 = '7'**)
- SW=1 : 1 byte command 0 - F (HEX expression in ASCII)
- SW=2 : 2 byte command 10 - FF (HEX expression in ASCII)
- SW=3 : 4 byte packet data for test data transmission

function name	function	data (ASCII)	range (HEX)
SW	command switch	0	0
CMDT0	command	F	F
CMDT1 - 8	command	0 - 9, A - F	variable

- * 'SW' switches the command type of the Control Command.
- SW=0 : 9 byte command for remote control code (**CMDT0 = 'F'**)

3.1 System Commands (SW = '2')

System Commands can be made by setting the 'SW' byte in the Control Command to '2'. With System commands you can control the RX-Vx700's system settings (Report Command Enable / Disable, Report Command delay, etc...)

With a System Command you can also...

- set absolute master volume value.
- send text strings to the On Screen Display (OSD).
- request RX-Vx700 text data regarding tuner freq., master volume, input name, zone 2 input name.

***OSD message function**

The OSD Message function can display a message of 16 characters to the RX-Vx700's OSD for a few seconds. The command sequence block will start by sending "start command" as mentioned above, followed by four bytes of packet data (SW:3) repeated four times. Then a message of sixteen characters (ASCII) will display and the command block will finish automatically.

(ex.) Want to display " Test message ! " characters to OSD.

1. Send the start command.

STX	2	1	0	0	0	ETX
-----	---	---	---	---	---	-----

2. Send SW:3 commands four times as follows.

STX	3	' '	'T'	'e'	's'	ETX
STX	3	't'	' '	'm'	'e'	ETX
STX	3	's'	's'	'a'	'g'	ETX
STX	3	'e'	' '	'!'	' '	ETX

3. The command block will be finished automatically.

Characters available for displaying the message are as follows:

" (SPACE) !" "#" "%" "&" "(" ")" "*" "+" ", " "-" "." "0" "1" "2" "3" "4" "5" "6" "7" "8" "9" ":" "<" "=" ">" "?" "A" "B" "C" "D" "E" "F" "G" "H" "I" "J" "K" "L" "M" "N" "O" "P" "Q" "R" "S" "T" "U" "V" "W" "X" "Y" "Z" "[" "]" "_" "a" "b" "c" "d" "e" "f" "g" "h" "i" "j" "k" "l" "m" "n" "o" "p" "q" "r" "s" "t" "u" "v" "w" "x" "y" "z"

***Commands to get the display characters as text data (ASCII)**

This command can get certain text data (ASCII) from the RX-Vx700 to be used by a host device as follows.

- Tuner frequency characters : " 1 07.9 "(MHz)
- Master volume value characters : "-40.0dB" / " MUTE"
- Input name : " MY PC " (Even renamed by "SET MENU:INPUT RENAME")
- Zone2 input name : " PS 2 " (Even renamed by "SET MENU:INPUT RENAME")

The response protocol for the text request commands are as follows.

RCMD0,1	COMMAND	0 - 9,A - F	0...0xFF
DDAT 0 - 7	DATA	0 - 9,A - Z SP	ASCII char. Space char.

4. Reset Command

The Reset Command recalls factory preset data. Once the factory presets are recalled, all user controllable setting / parameter data will be deleted and replaced with original factory settings.

Do not use this command unless you have been experiencing problems with the system or if you just want to clean up the system.

After the system is reset, request the Configuration Command using the Ready Command (see section 2) in order to get accurate feedback of RX-Vx700 status to your touch panel system.

5. Report Command

The RX-Vx700 will send a Report Command in response to Control Commands from the host controller. From the Report Command you can receive the current status of the RX-Vx700.

There are three types of Report Commands classified by their information type.

- System Status Report RX-Vx700 reports a System Status Report when the system status has changed.
- Playback Status Report RX-Vx700 reports a Playback Status Report when the internal playback status has changed.
- Operation Report When the RX-Vx700 is controlled by remote controller, front panel, RS-232C or system controller, the RX-Vx700 sends an Operation Report, which includes the latest setting status of the controlled function.

*The RX-Vx700 reports a System State Report with system guard to inform its power status (power off) if it receives a control command while it is turned off.

*The guard status is included in the Report Command (GRD). If the control command the host sent was accepted, the guard status in the Report Command is '0' (No Guard).

On the contrary the guard status will be 'System Guard' or 'Setting Guard' if the command was guarded for some reason. (e.g. If you send a 'Speaker A ON' command while you are using a headphone, the guard status will be 'System Guard' because the speaker controls are prohibited when a headphone is being used).

*If a status changes multiple times in a certain time, the RX-Vx700 reports only one report command.

function name	function	data (ASCII)	range (HEX)
TYP	control type	0 - 9	0 - 9
GRD	guard status	0 - 9	0 - 9
RCMD0, 1	command	0 - 9, A - F	0 - 0xFF
RDAT0, 1	data	0 - 9, A - F	0 - 0xFF

<Control type> This indicates for which type of control the report command is.

TYP	control type
0	controlled by RS-232C
1	controlled by remote controller (IR)
2	controlled by keys in the unit
3	controlled by system
4	controlled by encoder

<Guard status> This indicates guard status against all control commands

GRD	Guard status*
0	no guard
1	system guard
2	setting guard

5.1 System Status Reports

RCMD0, 1	Report Item	RDATA0, 1	Status
00	system	00	OK
		01	Busy
		02	Standby

Ready to accept control commands
 Start of the term prohibits sending commands
 Report against commands which cannot be accepted when Power is on Standby

*RX-Vx700 sends this report when the system is reset or the power turns off.
 It can be used for observation of the system revival.

Attention

- * When the Input is changed, the RX-Vx700 sends an Operation Report for Input (RCMD0,1="21") and Audio Select (RCMD0,1="22").
- * When the System Memory is changed, the RX-Vx700 sends an Operation Report for System Memory (RCMD0,1="30") and Configuration Command.
- * When a headphone is plugged into the headphone jack and the Speaker Relay is turned off, the RX-Vx700 sends an Operation Report for Speaker Relay A and B (RCMD0,1="2E","2F", RDAT="00(OFF)"). The RX-Vx700 sends an Operation Command for Speaker Relay A and B when the headphone is removed also.
- * Each time the source from the Inputs or playback status (ex. 6.1/ES, RED DTS etc.) of the system changes, the RX-Vx700 sends a Playback Status report.
- * Each time the busy status of the system changes, the RX-Vx700 sends a System Status report.

Example of RX-Vx700 Control Procedure

[1] Connection Start procedure (AC Plug / RS-232C cable connection)

When the AC plug / RS-232C cable are not connected, the RX-Vx700 cannot send any data to the host. If the host doesn't receive a configuration command after sending a Ready command 5 times, the host should disable the RS-232C communication and send an alert to the graphic user interface (GUI).

[2] AC plug / RS-232C connection check sequence after the connection has been confirmed in the procedure [1].

If the host doesn't receive a Report Command within 500ms of sending a command, the host should resend the command. If no Report Command is received after sending 5 times, check the AC plug/RS-232 cable (cf. [1]).

When the RS-232C cable is disconnected, the commands generated inside the RX-Vx700 are stored in the sending buffer. If the stored commands exceed the buffer memory size (buffer overflow), the RX-Vx700 stops reporting any commands. In this case, reconnecting the AC plug or Connection Start procedure [1] will be needed in order to enable the command report.

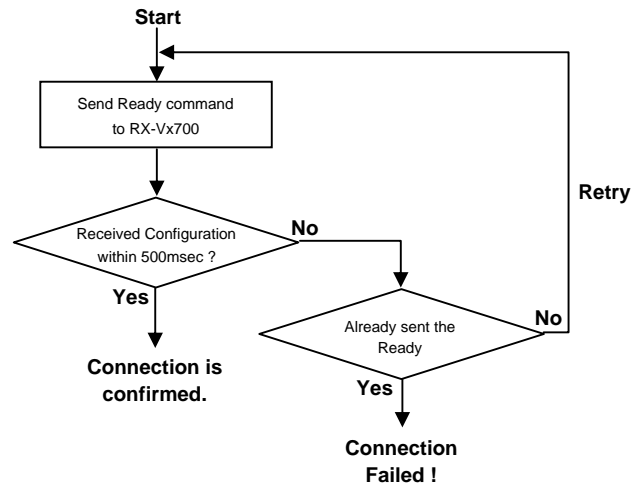

[3] AC plug connection detection (after [1],[2])

When the AC connection is reset, the RX-Vx700 sends a Configuration Command to the host. The host can display the status of the RX-Vx700 to its GUI.

[4] Getting the status of the RX-Vx700 when the host boots up

At first, the host should send a Ready command and receive the Configuration Command from the RX-Vx700 (cf. [1]). Once the connection is confirmed, the host can send Control Commands to the RX-Vx700. When the RX-Vx700 is turned off, it accepts only System Commands and Power ON command.

[1] : AC Plug / RS-232C connection check (Start transaction)

[5] Error transactions after [4]

While sending a control command, if the RX-Vx700 didn't send any corresponding Report Commands regardless of re-trying for 5 times, the host should clear its send buffer and then check the AC plug / RS-232C connection sequence (cf. [1]). When the RX-Vx700 responds, the host can display the RX-Vx700 status to its GUI then return to the normal communication sequence. If not, the host should cancel the communication and report the alert to its GUI.
